

> Access to easy-to-use tools that reduce management time with Arcserve® Backup

In business, evolution is constant. Staff grows. New offices spring up. New applications are being implemented, and typically, you're the one on the hook to make sure that your data is always protected.

Arcserve Backup goes beyond backup, giving businesses highly reliable data protection with centralized management that makes sense, no matter how complex your data or its infrastructure is. Arcserve backup offers all this at a fraction of the cost of the competition.

Significantly reduce your backup storage and regain precious time with a comprehensive solution that combines data deduplication; integrated backup copy to public cloud storage; granular restore of applications such as Active Directory, Microsoft Exchange and Microsoft SharePoint; infrastructure visualization; and archiving—for both physical and virtual servers in a single package.

OVERVIEW

As organizations are challenged with managing increasingly vast volumes of information from applications, versions and growing numbers of virtualized servers, there is a new emphasis on improving data management efficiency. With Arcserve Backup, organizations have access to easy-to-use tools that reduce management time, and innovative technology that makes data protection simple.

BENEFITS

Arcserve Backup has extensive management features that work together to help reduce the time that you spend managing your backups. In this way, it provides "enterprise-class" functionality no matter how simple or complex your data or your IT infrastructure is. Arcserve Backup helps you quickly prepare for, respond to and recover from the disasters and disruptions that would otherwise threaten the integrity and reliability of your core business operations.

THE ARCserve ADVANTAGE

Arcserve Backup offers superior functionality for businesses of every size and type that need to protect the data that they rely on each day. In this way, Arcserve Backup helps to ensure that the data that your organization creates is protected and recoverable following a disaster or disruption. Moreover, Arcserve Backup is a core component of the larger Arcserve solution portfolio—providing you with the full continuum of data protection and available technologies to help meet all your data needs.

You'll be surprised at how much we can do for you.

We make managing your environment easy with a dashboard feature that shows you the status of your physical and virtual servers, storage and connectivity at a glance. We help you to avoid unplanned downtime as well as reduce your backup storage requirements with threshold alert settings and built-in data deduplication. We also display your environment in a simple network diagram to help you understand how everything is being protected and provide reports that you can send to your management and auditors showing the status of your data protection.

Arcserve Backup supports Windows, UNIX and Linux environments. Its modular architecture enables you to start small and grow as you need to, adding modules to provide additional levels of protection without having to learn a new product or buy another solution.

Arcserve Backup delivers a host of core capabilities, including:

INTEGRATED DATA DEDUPLICATION

Improve the economics of backup and recovery by enabling longer retention periods, providing a cost-effective means of reducing storage, protecting critical data and integrating, configuring and managing data deduplication in the existing backup environment.

VIRTUALIZING SERVERS WITH CONFIDENCE

Incorporate sophisticated backup and recovery functionality into VMware, Microsoft Hyper-V and Citrix XenServer virtualization technologies—easing management and mitigating the risk of data loss on virtualized servers.

GRANULAR APPLICATION RECOVERY

Quickly restore individual application objects from Active Directory, Microsoft Exchange, Microsoft SQL Server and Microsoft SharePoint applications speeding recovery.

INFRASTRUCTURE VISUALIZATION

Simplify system management with an easy-to-read network diagram view of your entire environment. The diagram includes all of the servers, storage and other devices, showing how they relate to each other and to the Arcserve Backup Media server(s). Easy drilldown on each component offers status, backup methodology and other key information to reduce management time.

DASHBOARD WITH STORAGE RESOURCE MANAGER (SRM) REPORTING

Proactively avoid downtime with graphical insight into your backup environment to monitor the status of all backup activities, find the nodes that are taking the longest, locate backed-up data, discover whether data is encrypted and ready for disaster recovery and track volume, disk and memory usage on each of your Production servers.

**CENTRALIZED MANAGEMENT AND ADMINISTRATION**

Reduce management time and help to provide faster responses by enabling IT administrators to manage, modify and control backup and restore jobs, media devices, activity logs, alerts, catalogs, product licensing and reports from a single point that spans local and remote servers and locations.

UNIX/LINUX DATA MOVERS FOR STORAGE AREA NETWORK (SAN)-BASED BACKUPS

Provide faster, more efficient backups and restores for databases and file systems on UNIX and Linux servers while also providing centralized management, reporting and licensing for all servers via the Arcserve Backup Media server.

ADVANCED BACKUP AND RESTORE SUPPORT

Protect your business-critical applications with specific agents— including Microsoft SQL Server, Exchange Server and SharePoint, Oracle, Lotus Domino, SAP R/3 and Sybase—and help to ensure data integrity by protecting the transaction log, archive log, journal files and all associated data.

FLEXIBLE BACKUP METHODS

Use high-performance, non-disruptive backup and restore operations that help to meet the specific needs of your mission-critical information and data assets. These include backup to disk, backup to tape, disk-to-disk-to-tape (D2D2T) backup, disk-to-disk-to-cloud (D2D2C) backup, virtual tape library (VTL) and Microsoft Volume Shadow Copy Service snapshot support, hardware snapshot support, multiplexing and multi-streaming. All of these work in concert to protect your data, help you to recover quickly and to meet your service-level agreements (SLAs) for recovery point objectives (RPOs) and recovery time objectives (RTOs).

WIDE AREA NETWORK (WAN) BANDWIDTH-OPTIMIZED REMOTE OFFICE BACKUPS

Eliminate tapes from remote offices by replicating remote office data to your central data center and perform non-disruptive Replica server backups—helping you to better utilize your existing backup resources.

SMART RESTORE CAPABILITY

Provide reliable recovery by redirecting restore jobs to other media containing the same data without any manual intervention, reducing the chances that errors will negatively affect your recovery processes.

FLEXIBLE DEPLOYMENT

Available as individual components, modules based on server type and packages based on capacity to meet your specific needs and purchasing requirements, making it incredibly easy to buy and manage your licenses.

ARCHIVING

Reduce backup windows, network traffic and storage management costs by archiving data to disk, tape or the cloud. This is important to manage the growing volumes of data while reducing the drain on your physical resources, prolonging your infrastructure investment.

INTEGRATED BACKUP COPY TO CLOUD STORAGE

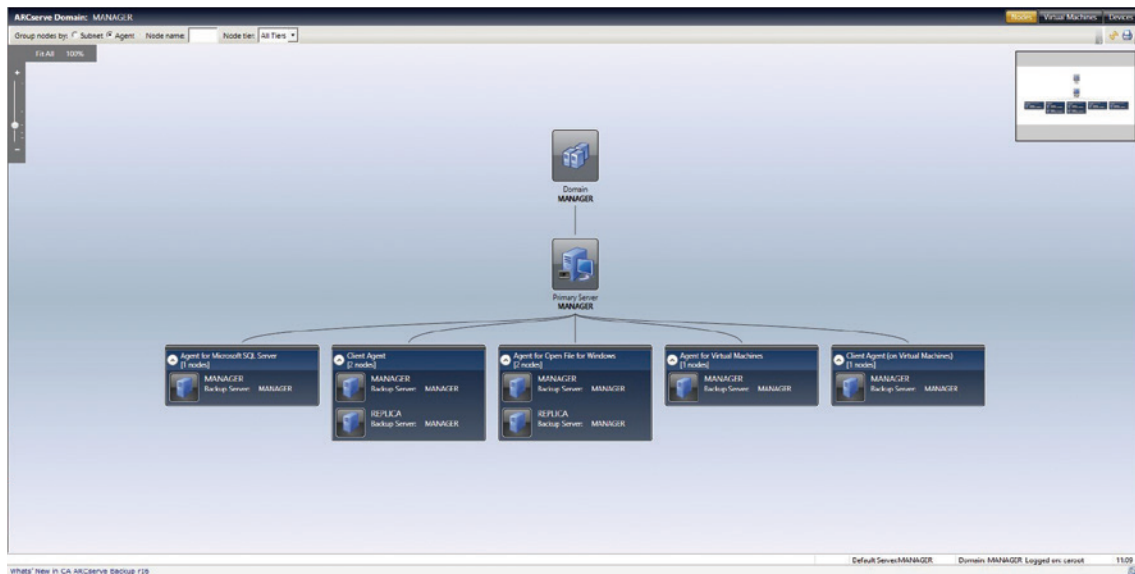

Easily take advantage of cloud services as part of a D2D2C backup policy for remote, off-site protection, archiving or additional storage capacity. It enables the flexibility of cloud services for your data protection and helps you to take advantage of operational budget instead of capital budget for your storage needs.

SYNTHETIC FULL BACKUP

Reduce recovery time and complexity by providing a “full” backup picture to recover from, eliminating the tedious process of restoring multiple backups to recover to a specific point in time. This is important because it results in less downtime, a more reliable recovery process and reduced IT resource time.

MIGRATE Arcserve D2D BACKUPS TO TAPE VIA THE Arcserve BACKUP CONSOLE

Storing data on tape is a requirement for many businesses that need to keep data long-term and/or off-site for future reference or recovery. You can easily clone Arcserve® D2D backups to tape media, catalog with Arcserve Backup and enable recovery via the Arcserve Backup console with a single point of management.

The Arcserve backup dashboard includes infrastructure visualization which provides a detailed graphical view of the backup environment, showing nodes and other entities with status as well as pop-ups to retrieve even more information.

New Features In Arcserve Backup

Now you can protect the latest Windows 10 and VMware vSphere 6.0 operating system platforms

- Arcserve Backup Client Agent for Windows, Agent for Open Files and Agent for Virtual Machines now support backup of Microsoft Windows 10 desktop workstation.
- Arcserve Backup Agentless Backup for VMware now supports backup of Windows 10 virtual machines using vSphere 6.0.
- Arcserve Backup can now discover and protect virtual machines running on vSphere ESXi 6.0 U1 and vSphere vCenter Server 6.0 U1 servers.
- Arcserve Backup ships VDDK 6.0.1 with every Agent for Virtual Machine installation, and this VDDK version adds support for new features of vSphere 6.0 such as Virtual Volumes and newer VM hardware versions.
- Arcserve Backup supports vSphere versions 5.1 and above (VDDK 6.0.1).
- Arcserve Backup introduces a new feature to back up full de-duplicated/compressed RPS data stores directly to tape.
- Arcserve Backup supports new LTO 7 tape drives (scheduled to be released in late 2015) and LTO7 tapes (scheduled to be released early in 2016).
- New with Arcserve Backup is the Enterprise Option for SAP HANA, which provides backup and recovery of complete SAP HANA databases.
- For enhanced unification and ease of use, Arcserve Backup delivers a new Unified Tape Management module and a new Unified Product Installer.
- Arcserve Backup ships with JRE 1.8. JRE 1.8 is a critical Java upgrade which includes several security and bug fixes. JRE 1.8 offers enhanced stability and security.
- Arcserve Backup provides database level backup and restore of Microsoft Exchange Server 2016.
- Arcserve Backup supports new Exchange Granular Restore Utility that enables the recovery of any Exchange object from an offline Exchange database or recovery point created by Arcserve.
- Arcserve Backup supports NDMP backups of NetApp Data ONTAP 8.3 filers, including two-way and three-way NDMP for direct attach tape drives, and Filer-2-Server backups of NDMP volumes to a destination on backup server. It also supports NetApp clusters (c-mode).
- The default database shipped with Arcserve Backup is changed to Microsoft SQL Server Express 2014 SP1.

PRODUCT BRIEF

The Arcserve Advantage

Arcserve Backup provides a comprehensive backup solution, especially useful for large complex IT environments or for those which require “direct to tape” backup. Built-in data deduplication at no additional cost helps reduce total cost of ownership (TCO) as well as storage requirements and cost.

Part of the Arcserve Solution Portfolio

As a key component of the Arcserve solution portfolio, Arcserve Backup delivers the functionality that helps you to maximize the performance, efficiency and effectiveness of your backup and recovery strategy. By integrating the control of your operations, you’ll better manage risk, costs and service—and help ensure that recovery and availability measures align with business goals.

Take the next step.
